sub-linear functional

Given a (real) vector space E , a mapping $p : E \rightarrow \mathbb{R}$ is *sublinear* if for every $x, y \in E$ $p(x + y) \leq p(x) + p(y)$, and for every $\lambda \in \mathbb{R}_+$, $p(\lambda x) = \lambda p(x)$.

CHB property on a (real) topological vector space E

For every *continuous* sub-linear functional $p : E \rightarrow \mathbb{R}$, every vector subspace F of E , and every linear mapping $f : F \rightarrow \mathbb{R}$ such that $f \leq p|_F$, there exists some linear mapping $g : E \rightarrow \mathbb{R}$ extending f such that $g \leq p$.

The *HB* property on a real vector space

The Axiom of Choice says:

AC : *If $(A_i)_{i \in I}$ is a non-empty family of non-empty sets, there exists a mapping $f : I \rightarrow \cup_{i \in I} A_i$ such that for every $i \in I$, $f(i) \in A_i$.*

ZFC and ZF

- In **ZF+AC** (set-theory with the Axiom of Choice), “Every (real) normed space satisfies *CHB*”.
- In **ZF** (set-theory without the Axiom of Choice), ℓ^∞/c_0 may fail to satisfy *CHB* ([Ho-Ru], [J], [P]).

We work in set-theory without the Axiom of Choice **ZF**.

An equivalent of the CHB property ([Dodu-M])

The CHB property on a normed space E is equivalent (in $\mathbf{ZF}$) to the following “geometric form”: given a closed subset C of E and a point $a \in E \setminus C$, there exists f in the unit sphere of the continuous dual E' such that $f[B(a, R)] \leq f[C]$, where $R := d(a, C)$.

The following spaces satisfy (in $\mathbf{ZF}$) the CHB property:

- Normed spaces with a dense well-orderable subset (e.g. separable normed spaces): see [Fossy-M].
- Uniformly convex Gâteaux differentiable Banach spaces (e.g. Hilbert spaces): see [Dodu-M].
- Uniformly smooth Banach spaces: see [Albius-M].

UG differentiability implies **CHB** (in **ZF**)

Axiom of Dependent Choices (*DC*)

Given a binary relation R on a non-empty set X such that $\forall x \in X \exists y \in X xRy$, there exists a sequence $(x_n)_{n \in \mathbb{N}}$ in E such that $\forall n \in \mathbb{N} x_n R x_{n+1}$.

Recall that **AC** $\Rightarrow$ **DC** $\Rightarrow$ **AC**($\mathbb{N}$) (converses are false).

Theorem ([Dodu-M])

In **ZF**+**DC**, Gâteaux differentiable normed spaces satisfy the *CHB* property.

I do not know if this statement holds in **ZF** (or in **ZF**+**AC**($\mathbb{N}$)).

Theorem ([M], preprint 2007)

Every uniformly Gâteaux differentiable normed space satisfies (in **ZF**) the *CHB* property.

Definition

Given $a \in E \setminus \{0\}$ and $h \in E$, let

$$G^\pm(a, h) := \lim_{t \rightarrow 0^\pm} \frac{\|a + th\| - \|a\|}{t}$$

The mapping $G^+(a, .)$ (*resp.* $G^-(a, .)$) is sub-linear (*resp.* super-linear) and continuous, and $G^-(a, .) \leq G^+(a, .)$.

-The norm $\|\cdot\|$ is *Gâteaux differentiable* (G-diff.) at point a if $G^-(a, .) = G^+(a, .)$.

-The normed space E is *G-differentiable* if its norm is G-diff. at each non-null point.

If E is G-diff at a point $a \in E \setminus \{0\}$, then $G(a, .)$ is the unique norming form at point a .

Definition

E satisfies the *Finite Extension* (FE) property if for every finite dim. subspace V of E , and every linear form $f : V \rightarrow \mathbb{R}$, there exists a linear form $g : E \rightarrow \mathbb{R}$ extending f with $\|g\| = \|f\|$.

Lemma

If E is G-differentiable, then E satisfies the FE property.

Proof.

Let V be a finite dimensional vector subspace of E . Let $f : V \rightarrow \mathbb{R}$ be some non null linear mapping. Since V is finite dimensional, the closed unit ball of V is compact, thus f attains its norm at a point a in the unit sphere of V . Since $G(a, \cdot)$ is the unique norming form at point a , it extends $\frac{f}{\|f\|}$; thus $\|f\|.G(a, \cdot)$ extends f and has the same norm as f . $\square$

Sketch of the Proof

Let $\mathcal{L}$ be the lattice generated by $\mathcal{C}$. Let $\rho > 0$ and let B be the large d -ball $B_d(a, \rho)$. Let $\mathcal{A}$ be subset of non-empty elements $\mathcal{C}$ which is closed by finite intersection and such that $B \in \mathcal{A}$. Let us show (in **ZF**) that $\cap \mathcal{A}$ is non-empty. Let $\mathcal{F}$ be the filter of $\mathcal{L}$ generated by $\mathcal{A}$. Let $R := \inf\{r \in \mathbb{R}_+ : B_d(a, r) \in \mathcal{S}(\mathcal{F})\}$. Denote by $\mathcal{A}'$ the set $\{A \cap B_d(a, r) : A \in \mathcal{A} \text{ and } r > R\}$. If $R = 0$ then $a \in \cap \mathcal{A}$. If $R > 0$, then for every $\varepsilon > 0$, there exists some element of $\mathcal{A}'$ which is included in the crown $D_d(a, R - \varepsilon, R + \varepsilon)$. Since $\mathcal{C}$ satisfies the property of $(d_i)_{i \in I}$ -smallness in thin d -crowns centered at a , the centered family $\mathcal{A}'$ is Cauchy in the gauge space $(X, (d_i)_{i \in I})$; since this gauge space is complete and Hausdorff, $\cap \mathcal{A}'$ is a singleton $\{a\}$. This singleton is **ZF**-definable from $(X, (d_i)_{i \in I})$, d , $\mathcal{C}$ and $\mathcal{A}$ whence the close c-compactness.

Theorem (Dodu-M, Lemma 1)

Let E be a Hausdorff tvs. If C is a convex subset of E , and if P is a strict polyhedra of E disjoint from C , then there exists $f \in E'$ such that $f[P] < f[C]$.

Beginning of the proof.

P is of the form $P = \bigcap_{i=1}^m \{x \in E : f_i(x) < \alpha_i\}$. where $f_1, \dots, f_m \in E' \setminus \{0\}$ and $\alpha_1, \dots, \alpha_m \in \mathbb{R}$. Let $V := \bigcap_{i=1}^m \text{Ker}(f_i)$, let F be a finite dimensional subspace of E such that $V \oplus F = E$ and let $p : E \rightarrow F$ be the projection on F with kernel V . Since the f_i are continuous, $p : E \rightarrow F$ is continuous. Moreover, since the tvs E is Hausdorff, its finite dimensional subspace F is isomorphic with the usual space $\mathbb{R}^d$ where d is the dimension of F .

Theorem

Let E be a normed space. Let d be the distance given by the dual norm on E' . Let $(d_h)_{h \in E}$ be the canonical gauge space of the weak topology on E' . If E has a w^* UR dual norm, then the class $\mathcal{P}_b := \{P \cap B(0, r) : P \in \mathcal{P} \text{ and } r \in \mathbb{R}_+\}$ has the property of $(d_h)_{h \in E}$ -smallness in thin d -crowns centered at $0_{E'}$.*

Proof.

Let $h \in E$. Let $\varepsilon > 0$. Since the dual norm of E' is w^* UR, let $\eta > 0$ such that for every $a \in S_E$, and for every $f, g \in C_{a, \eta}$, $|f(h) - g(h)| < \varepsilon$. Let $P \in \mathcal{P}$ such that $P \cap B(0, 1 - \eta) = \emptyset$. Using the previous **ZF**-provable consequence of **HB**, there exists $a \in S_E$ such that $\tilde{a}[B(0, 1 - \eta)] < \tilde{a}[P]$, thus $(P \cap B_E) \subseteq C_{a, \eta}$, thus for every $f, g \in (P \cap B_E)$, $|f(h) - g(h)| < \varepsilon$. □
